

The AI that thinks *before* the consult, and acts *after* it.

A copilot for small vet clinics. Briefs the doctor before, structures the notes during, follows up with owners after — escalating only what needs their eyes

+ RM 145 billing

The problem?

DR. TEOH BAK PENG · 3-DOCTOR CLINIC, SG DUA

Monday, *8:02am* BEFORE THE CONSULT

22 patients on the schedule. Before his first consult, Dr. Teoh spends 8 minutes flipping through Milo's paper notes from three visits ago, trying to remember — did the ear infection clear up? Did the owner ever agree to that dental?

THE HIDDEN COST

8 min

per patient, reconstructing context from fragments — **22 times today.**

Monday, *2:15pm* DURING THE CONSULT

He wraps up, dictates notes on the fly. In the rush, he forgets to bill the E-collar he recommended and the follow-up radiograph he mentioned. RM 145 — gone. Multiply across 20 patients. It happens 2 or 3 times a day.

QUIET REVENUE LEAK

RM 145

unbilled per missed consult — **bleeding silently, every single day.**

Wednesday, *9:40am* AFTER THE CONSULT

Milo went home Monday. Nobody called. Two days later the ear infection came back worse . The owner is frustrated — "why didn't anyone follow up?" Dr. Teoh only finds out when they walk back in.

WHAT GETS MISSED

0

systematic check-ins after discharge.

Complications found by accident.

NOT ONE CLINIC. EVERY CLINIC.

Small vet clinics in SEA are *drowning in admin* and *bleeding revenue* they never see.

3+ hrs

lost per doctor per day to admin,
note-writing and follow-up
coordination

10–15%

of billable items **mentioned but not
charged** per consult — silent
revenue leak

0

systematic post-discharge
complication check . The city is the
hospital.

Consilium owns the *decision layer* for vet clinics.

One AI copilot wrapping the whole patient loop — before, during, and after — so the doctor keeps the judgement and we take the drag.

Before

Pre-Consult Intelligence Brief

- Doctor clicks a patient on the **pet passport** . No SQL, no digging, no remembering
- LLM reads **years of inconsistent free-text notes** across visits and formats
- Surfaces **compliance patterns, chronic flags, pending items**
— exactly what to check today
- Ready before the owner sits down. Context, without the file drawer
- Suitable for any clinics

TIME SAVED, PER DOCTOR

4 min × 20 patients / day = 80 minutes back,
daily

80 min

of judgement time, returned to the doctor

During

Consultation Capture

- **SOAP note** S / O / A / P, structured medical record auto-generated from free-text.
- **Prescription** drug, dose, duration, quantity — ready to print or dispense.
- **Billing recovery** cross-refs diagnosis vs. billing matrix. Flags mentioned-but-not-billed.
- **Staff to-do** follow-ups, discharge prep, vaccine reminders — auto-assigned.

Final Decision by the Vet, not the AI

REVENUE RECOVERED, PER CLINIC

10% recovery × 400 consults/mo × RM 250 avg
ticket

RM 10,000

recovered per month, per small clinic

After

AI Follow-Up Triage.

- **Telegram bot** messages the owner 24–48h post-visit. Live today at @consilium_vet_bot.
- LLM reads the reply in natural language, scores confidence, and routes.
- The doctor **only sees the red flags** . Everything else clears itself.

ALL CLEAR

> 85% confident

"She ate breakfast and is bouncing around like normal."

MONITOR

60–85% confident

"Eating a little, still a bit slow but better than yesterday."

ESCALATE

< 60% confident

"She's bleeding from the incision and won't stand."

DOCTOR ATTENTION, RECLAIMED

1 message per red flag not 1 call per patient

~8% of cases

reach the doctor — the ones that actually should

The doctor's single pane of glass.

Escalations land within 1–2 seconds of an owner's reply, via Supabase Realtime

Consilium.

Every correction makes *this clinic's* Claude a little sharper than the next.

01 · DOCTOR DECIDES

One-tap correction.

No typing. The doctor approves a Claude output, or flags it as wrong — wrong triage level, wrong medication, missing item.

```
[ ✓ Correct ] [ ✗ Wrong → reason ]
```

02 · LOGGED IN SUPABASE

Stored as a correction row.

Feature, the model's output, the rejection reason, and the doctor's correction land in the corrections table.

```
feature: 'triage'  
was: MONITOR  
fix: ESCALATE — wound infected
```

03 · INJECTED NEXT TIME

Re-injected as few-shot.

Before the next Claude call for that feature, the latest 5 corrections from this clinic are pulled and injected into the system prompt as examples.

```
system += clinic_corrections[:5]
```

No retraining. No fine-tuning. Just *prompt-shaped memory* that compounds with every doctor tap — and stays inside the clinic.

WHAT THE DOCTOR SEES

✓ Correct

✗ Wrong triage

✗ Wrong med

✗ Missing item

One tap. No keyboard. The whole loop runs in under two seconds.

Tech Stack

Design choices

- **Claude is structural.** Sonnet 4.6 for consult capture and triage, Haiku 4.5 for the speed-read brief. Vision built in — wound photos go through the same model.
- **Realtime-first.** Supabase Realtime means escalations arrive on the dashboard before the owner finishes typing.
- **Telegram, not app download.** Owners already use it. Zero friction. Polling today, webhook ready for prod.
